**Description**

Issue with instructions [https://redmine.openinfosecfoundation.org/projects/suricata/wiki/OpenBSD_Installation_from_GIT](https://redmine.openinfosecfoundation.org/projects/suricata/wiki/OpenBSD_Installation_from_GIT)

After:

```bash
git clone https://github.com/OISF/libhtp.git -b 0.5.17
```

and then calling make results in:

"implicit declaration of function htp_config_set_response_decompression_layer_limit"

```c
line 2407 app-layer-htp.c :
2406 │ #ifdef HAVE_HTP_CONFIG_SET_RESPONSE_DECOMPRESSION_LAYER_LIMIT
2407 │             htp_config_set_response_decompression_layer_limit(cfg_prec->cfg, value);
2408 │ #else
```

Changing to:

```bash
git clone https://github.com/OISF/libhtp.git -b 0.5.21
```

fixed the problem for me on: OpenBSD openbsd 6.1 GENERIC.MP#20 amd64

happy to make the change if possible (and if I knew how)

Looks like others have hit similar issues with libhtp. I inferred my solution from reading through this:

**History**

**#1 - 09/06/2017 03:49 PM - Andreas Herz**

- Status changed from New to Closed
- Assignee set to OISF Dev

I added the newest release to the Wiki Page and the hint to use more recent versions. Unless we move those installations to sphinx docs and can generate them everytime it's a manual task to bump the version numbers. So it's always the best to use the latest stable versions.
