**Label:**

**Description**

The suricata-verify test.yaml contains a great way to create regression tests. However creating the test files is tedious. It usually involves taking a eve.json record and then manually creating a matching test.yaml.

I would like to have a small util script in python, that converts an eve.json to the test.yaml format.

Something like:

```
eve2test eve.json > test.yaml
```

If I understand correctly, only the verification filters are run over `eve.json` so this utility should actually create just the `filter` block and write it in a test file. Developer may then provide all other options like min-version of Suricata, requires, etc. Please let me know.

Lets start that way, yes. We can consider adding more logic later, but this is the most valuable first step I think.

Some very good reassembly/defrag/vlan corner cases could be found here - [https://github.com/pevma/PtP/blob/master/Examples/Example](https://github.com/pevma/PtP/blob/master/Examples/Example) with the actual pcaps and rules located here - [https://github.com/pevma/PtP/blob/master/Examples/PacifyOneHttpRequest.tar.gz](https://github.com/pevma/PtP/blob/master/Examples/PacifyOneHttpRequest.tar.gz). I think the utility would make it much easier to add those form the respective resulting eve.jsons into the suricata-verify.
