### Description
To enable rulesets to introduce new classtypes, and to allow multiple rulesets to co-exist, Suricata-Update should manage classification.config.

It should take the local one (/etc/suricata/classification.config) plus any that is part of the rulesets and merge them. Since Suricata ships some rules, it should also include one we ship, so /usr/share/suricata/...

The resulting file should go somewhere in /var/lib/suricata/

(side note: we should probably do the same for reference.config)

In case of conflicting definitions, it should probably take the highest priority/severity.
