Hello,

so I'm trying to use Suricata as an IDS/IPS but do not know if I should disable all rules and create custom rules but if so, how do I do it?

thank you

You can use suricata-update to manage rulesets. What you want to enable or disable depends on what you want to achieve. See https://suricata.readthedocs.io/en/latest/rule-management/index.html for more details about suricata-update.
