The Open Build Service (OBS) is a generic system to build and distribute packages from sources in an automatic, consistent and reproducible way. It makes it possible to release software for a wide range of operating systems and hardware architectures. The OBS reference server, which we use to build our distribution, currently has over 35,000 users that are building over 200,000 packages for 22 base distributions on 6 architectures.

This packaging system should be explored, the same way we explore(make use of) the Ubuntu PPA.
